

TESTIMONIAL

Simba has chronic skin issues since the last 4 1/2 to 5 years. He was diagnosed with an enlarged heart which makes him cough when he is excited and stops him from doing any kind of vigorous activity. His liver enzyme levels were high. He has age-related spondylitis. He is on medication for his heart, joints and skin.

At the time when he first saw Niyati, he was unable to walk due to the spondylitis and we needed to use a trolley to transport him. Within a few days of receiving his first session of Craniosacral therapy, he started walking again.

He has been receiving Craniosacral therapy once a week over the last 6 months. His coughing has reduced and his ECG results have improved over the last 3 months. His liver levels have normalised.

His skin issues have significantly improved – the open weeping sores have dried up and his fur is growing well. We have been able to reduce the medication for his skin condition.

The fussiness in his eating habits has also reduced and he is more receptive to his meals especially during the 2-3 days following a session of Craniosacral therapy.

Craniosacral therapy has helped Simba a lot and we are continuing with his sessions to support his good health. I would like to thank

Niyati for her tireless efforts and for managing to improve Simba's health significantly even at his advanced age
